The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (SI). Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful a marker for breast cancer and in breast cancer therapy. Sequences given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              in records ACN78851-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to the isolation of human protein

modification and maintenance molecules (PWMM), and the polymucleoride

sequences encoding them. A total of 40 PMM polypeptides (designated PMM

1 to PMMM-40) are disclosed. The sequences of the invention are useful

cor diagnosing a condition or disease associated with the expression of

to for diagnosing a condition or disease associated with the expression of

PMM in a subject, preparing a polycloan or monoclonal antibody, and

generating an expression profile of a sample containing the expression of

polymucleorides. The diseases or conditions associated with decreased

corpression or overexpression of PMMM are cell proliferation disorders (

corpression or overexpression of PMMM are cell proliferation disorders (

corpression or overexpression of PMMM are cell disorders, (

dispendence, atherosclerosis), neurological disorders, (

allergies), developmental disorders (e.g. hypothyroidism, Cushing's

syndrome), gastroinfestinal or paithelial disorders, and infections. The

PMMM polypeptides or their fragments are useful in screening compounds

for effectiveness as agonists or antagonists of the polypeptides, or in

caltering the expression of the target polymucleotide and compounds that

corporation or modulate the activity of the polypeptide.

ACA92416-ACA92455 encode the human PWMM polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                   New human protein modification and maintenance molecules (PMMM), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant PMMM expression e.g. cancer, atherosclerosis, or infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       299 GATGCTGATGGTGATGGAGATTTTGATGTGGATGATGCCAAAGTTTTATTAGAGACTTAAA 358

Ľ, Jones Dickson MC, Stache-Crain B, New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.

Claim 1; SEQ ID NO 34279; 44pp; English.

ò 셤 ઠે g ઠે g ò 셤 à

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50813, whose sequence was determined by the technique of SBH (sequencing by hybridiaation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleac and sequences care useful in diagnostics as axpressed sequence tags (BST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of procein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The secent sequence cobtained in electronic format directly from USPPTO at cottonic format directly from USPPTO at sequence. Obtained in electronic format directly from USPPTO at sequence.

```
AB056306 to AB060787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78993 to ABB79004 represent proteins encoded by the AB060776 to AB060787 nucleic acid sequences. (I) can be encoded by the AB060776 to AB060787 nucleic acid sequences. (I) can be caded in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and nucleic acid which hybridises to (I) in a cell. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), and for determining the phenotype of cells in a sample of coll cancer in a cell or tissue type, for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate or acorrasponding gene resides, and in tissue profiling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise antibodies, and to screen for peptide analogues and antagonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.

Claim 1; SEQ ID NO 26964; 80pp; English.

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide capteness in the specification, or their complements or fragments, and sendences in the specification. The probe is a single exon probe that conding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that conding at least 8 amino acids of any of the 6888 amino acid sequences (bybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially.

Condressable set of single exon nucleic acid probes for measuring human gene expression, a method of probes cited above, where each of the plurality of probes gited above, where each of the plurality of probes gited above, where each of the plurality of probes of the above and addressably isolatable or amplifiable from the single exon microarray for measuring human gene expression, a vector comprising at least 8 method of probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above mentioned amino acid sequences (Optionally with conservative amino acid substitutions), an isolated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to thousn gene expression and abscribtion, and a computer-readable storage medium which contains a database having a plurality of records cited above. The probes methods and apparatus are useful in gene expression and addition, the probes methods and apparatus as tools for surveying a pecific exon, or in constructing genome-derived single exon microarrays. The addition, the probes are used in identifying and characterising gross alterations in the genomic lower by the probes are used in identifying and characterising gross alterations in the genomic lower by priming the synthesis of nucleic acids or in expressing the ORF-encoded peptide cite

cited above. The probe, methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising alternative splicing events, in detecting and characterising gross alternative splicing events, in detecting and characterising gross smaller genomic alterations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      162 GGAACTICATICITCACGIGGITITAIGGIGAITIGCAITIGCIGGCGICTGGACAICTGIA 221

The invention relates to nucleic acid sequences (AAX22111 to AAX22134) encoding human secreted proteins (AAY01155 to AAY01159). The secreted proteins (AAY01155 to AAY01159). The secreted protein sequences are deposited with the ATCC under deposit number ATCC 209118. Host cells comprising recombinant vectors containing the nucleic acid sequences are used for the recombinant production of the nucleic acid sequences are used for the recombinant production of the number of a secreted proteins. The polymuclectide and amino acid sequences are useful for are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Pathological conditions can be also diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypeptides in a sample or by determining products for the diagnosis or treatment of polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foctal deficiencies, action autoimmune diseases, lymphomas, Alzheimer's and cognitive disorders, actoinmune deficated disorders, immune deficiency disorders, actionated disorders, and action disorders, neural disorders, immune disorders, actionated disorders, osteletal disorders, osteletal disorders, endocrine disorders are also useful for identifying their binding partners. The present sequence represents a number and clone identification)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       263 AGGAAAACTAGGAATCTATGATGCTGATGGTGATGGAGATTTTGATGTGGATGATGCCAA 322

The invention relates to novel genes ADA39629-ADA40565 and proteins
C ADA40566-ADA41501 for human secreted proteins, useful for preventing,
c treating or ameliance in medical conditions e.g. by protein or gene
C therapy. The polypeptides, nucleic acid molecules, antibodies or their
C fragments, and agonists or antagonists that bind to the polypeptide are
C diagnosing or treating a diagnostic or pharmaceutical composition for
C diagnosing or treating cancer or other hyperproliferative disorder. The
C polypeptides and nucleic acid molecules are also useful for detecting,
C preventing, diagnosing, prognosticating, treating or ameliorating cancer
C or other hyperproliferative disorders including neoplasms, autoimmune
C or other hyperproliferative disorders (e.g. anaemia,
C or other hyperproliferation and disorders (e.g. anaemia,
C or other hyperproliferation and disorders (e.g. anaemia,
C or other hyperposia,), alleagic reactions including astemm or excema,
C or other hyperposia, alleagic reactions including astemm or casema,
C or other hyperposia, alleagic reactions including astemm or casema,
C or other disorders (e.g. ischemia-reperfusion injury, inflammatory
C or other disorders (e.g. ischemia-reperfusion injury, inflammatory
C or other disease or Crohn's disease, cardiacion injury, inflammatory
C or other disease or Crohn's disease, or anaemia,
C or other disease or Crohn's disease, or anaemia,
C or other disease or crohner including HIV/AIDS), or wound healing and
C or other inflamone including HIV/AIDS), or wound healing and
C or of epithelial cell proliferation, radiation hybrid markers, or as
C or other disance immunological probes for differential identification
C or this patent did not form part of the private or or disagnostic providing lamunological probes to the private or disagnostic prov
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    263 AGGAAAACTAGGAATCTATGATGCTGATGGTGATGGAGATTTTGATGTGGATGATGCCAA 322

                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel human secreted proteins (ABR47633-6 ABR48145) and their coding sequences (ACC50344-ACC50856). The proteins and their coding sequences are useful for the preparation of a diagnostic corp pharmaceutical composition for diagnosing or treating a cardiovascular disorder (e.g., arrhythmia, tachycardia, cardiac arrest, coronary carteriosclerosis and myocardial ischaemia), neural disorders, immune system disorders muscular disorders, pulmonary disorders, reproductive disorders; immune cyproliferative disorders and/or cancerous diseases and conditions, for treating thrombosis and arteriosclerosis, for treating or infection, for treating thrombosis and arteriosclerosis, for treating or preventing neural damage which occurs in neuronal disorders or infection, for the analysis and arteriosclerosis, for treating or neurodegenerative conditions such as Alzhaimer's disease and Parkinson's disease, to enhance bone and periodontal regeneration and aid in tissue tramsplants or bone grafts, to prevent skin aging or hair loss, to stimulate growth and differentiation of haematopoietic cells and bone carnow cells when used in combination with other cytokines, to marrow cells when used in combination or the marrow cells when used in combination or provinces, to maintain or treated to the marrow cells when used or decrease differentiation or provinces, to maintain or treated to the marrow cells when the marrow of decrease differentiation or provinces, to maintain or the marrow c

The invention relates to 592 new human secreted polypeptides useful for diagnosing, treating or preventing e.g. immune disorders, inflammatory conditions, respiratory disorders, cancers, CNS disorders, inflammatory conditions, respiratory disorders, cancers, CNS disorders, and conditions, respiratory disorders, cancers, CNS disorders, and cancers and cancers are least 95% identical to the new sequences. The polypeptides, antibodies or antibody fragments that bind to the polypeptides, mucleic acids encoding the polypeptides, agonists or antagonists that binds to the polypeptide, are useful in preparing disgnostic or pharmaceutical compositions for diagnosing, treating or preventing an e.g. immune compositions for diagnosing, treating or preventing an e.g. immune compositions for disorders (e.g. gastric, ovarian or lung cancer) CNS disorders (e.g. multiple sclerosis or ischaemic Derain injury), neurodegenerative conspiratory disorders (e.g. parkinson's disease or Alzheimer's disease), and cardiovascular disorders (e.g. atherosclerosis or myocarditis). The cation controlling gene expression through triple helix formation or antisense DNA or RNA, in gene therapy, for identifying individuals from minute biological samples, in forensic biology, and as hybridization or antisense DNA or RNA, in gene therapy, for identifying individuals from minute biological samples, in forensic biology, and as hybridization or antisense DNA or RNA, in gene therapy, for identifying individuals for meating or preventing neural disorders, immune system disorders, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, reproductive, gastrointestinal, pulmonary, cardiovascular, can agene encoding one of the polypeptide of the invention. Note: The sequence data for this patent did form man discense in the polypeptide of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             233 AGGAAAACTAGGAATCTATGATGCTGATGGAGATTTTGATGTGGATGATGCCAA 292

(COMP-) COMPUGEN INC.

Mintz E, Mintz L, Faigler S; Shoshan A, Wasserman A,

New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and developmental-specific genes. WPI; 2002-257383/30.

Example 1; SEQ ID NO 11070; 47pp; English.

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcribed from multiple

() transcriptome comprises messenger RNAs transcribed from multiple

() transcription units that populate a genome. The library comprises several configuration units that populate a genome. The library comprises several configuration of the genome, which encodes one or more messenger RNAs splice variants. The configuration of the genome, which encodes one or more messenger RNA splice variants. The configuration of the genome, which encodes one or more messenger RNA splice variants. The configuration of the genome, which encodes one or more messenger RNA splice variants of human or animal transcriptome and splice variants of human or animal transcriptomes. The libraries and splice variants of human or animal transcriptomes. The libraries may also be used as specialised minication of the proposition of the secondary of tissue configuration or pathology-specific genes such as those genes only expressed in specific tissue under a specific pathological condition, to detect of variants of a transcriptome of a patient suffering from a particular developmental specific pathological condition, to detect of variants of a transcriptome of a patient suffering from a particular configuration. N.B. The sequence data for this patent did not form miss, human and mise, which are used in the exemplification of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_equences

This invention relates to a method of differentially modulating the growth or differentiation of blood endothelial cells (BEC) or lymphatic endothelial cells (LEC) comprises contacting endothelial cells with a composition comprising an agent that differentially modulates blood or lymphatic endothelial cells. Treating bereditary lymphocedema comprises contented with a mutation in at least one allele of a gene encoding a LEC protein, where the mutation in at correlates with lymphocedem and human subjects, and with the provise that the LEC protein is not VEGFR-3; and administering to the subject a correlates with lymphocedem a lymphatic growth agent selected from VEGFC or VEGF Deplypeptides and polymucleotides. The invention may be useful for the development of compounds with an antianglogenic, cytostato, vasorropic or antianflammancery activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood endothelial cells in treating hereditary lymphocedem; in screening for an endothelial cells, in treating hereditary or to bredisposition to the disorder or in monitoring the efficacy or toxicity of or a drug on endothelial cells. The agent is useful in manufacturing a cell or lymphatic vessel endothelial cells growth agent may also be used in manufacturing a medicament for the treatment of hereditary lymphocedem resulting from a mutation in a LEC gene or of other diseases and cancer metestasis via the lymphatic systems agent may also be used in manufacturing a medicament of the treatment of hereditary lymphocedem resulting from a mutation in a LEC gene or of other diseases involving the lymphatic vessels, such as carrious inflammatory diseases and cancer metestasis via the lymphatic system. The present sequence is that of a human LEC/BEC differentially enemended by the present enemended to the method of the invention. Note the sequence does not not annear in the method of the invention. sequence does not appear in the specification but was obtained by th indexer using the source data given in table 14 of the specification

This invention relates to the novel association of protein sequences (and the genes which encode them) to the NP-kappaB pathway. The invention may be useful for the production of compounds with an antinfinamatory, cytostatic, hepatotropic, virucide, antiarthritic, antinfindmanatory, gastrointestinal-Gen, antiasthmatic, antiarthritic, antinfindmanatic, immunosuppressive or immunomodulator, cerebroprotective, vasotropic, immunosuppressive or immunomodulator, or for gene therapy. The proteins and nucleotides are useful for diagnosing, preventing, treating, or ameliorating conditions or diseases associated with the NP-kappaB pathway. The condition is an immune disorder, an inflammatory disorder, shappaB regulation, cancer, aberrant apoptosis, hepatic disorders, Hoddkin's lymphomas, haematopoietic tumours, hyper-IgM syndromes, hypohidrotic ectodermal dysplasia, ximunodeficiency, viral infections, HIV-1, HTLV-1, ectodermal dysplasia, immunodeficiency, viral infections, HIV-1, HTLV-1, hepatitis B, hepatitis C, EBV, influenza, viral infections, HOV-1, HILV-1,

The invention relates to a novel isolated nucleic acid and the PRO polypeptide encoded by it. A protein of the invention has antiinflammatory, antiarthritic, antithemutatic, immunosuppressive, osteopathic, antidiabetic, dermatological, antipsoriatic, antiallergic, antiathmatic, hepatocropic, and respiratory activity. A polynucleotide of the invention may have a use in gene therapy. The PRO polypeptide, its agonist, antagonist, or antibody that specifically binds to the polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis,
survival, evasion of immune responses, rheumatoid arthritis, inflammatory bowel disease, colitis, asthma, atherosclerosis, cachexia, euthyroid sick syndrome, stroke, EAB, autoimmune disorders, disorders related to hyper immune activity, disorders related to aberrant acute phase responses, hypercongenital conditions, birth defects, necrotic leaions, wounds, organ transplant rejection, conditions related to organ transplant rejection, disorders related to aberrant signal transduction, proliferating disorders, cancers and HIV propagation in cells infected with other viruses. The present sequence is that of a human gene which is subject to the novel association with the NF-kappaB pathway of the invention.
                                                                                                                                                                                                                                                                                                                                          ö

ABB78993 to ABB79004 represent proteins encoded by the ABG60776 to ABG60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypoptic encoded by (I) is useful for detecting cancer in a patient sample, and for detecting the presence or absence of a polymoclacitie encoded by an uncleic acid which hybridises to (I) in a cell. A probe/primer derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid that is differentially expressed in cancer tissues useful for determining the presence of colon cancer in a cell or tissue type, and in antisense therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        59 GGCATCCGGAACTGACACACACAGAGACGCAGCCTTCCAGCAATTTAGCATGAATTC 1

ö
from (I) can be used for determining the presence of a nucleic acid which hybridises to (I), and for determining the phenotype of cells in a sample of cells from a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the corresponding gene resides, and in tissue profilling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise antibodies, and to screen for peptide analogues and antagonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying an agent that modulates the function of an apoptosis-associated polypeptide, useful for diagnosing or treating e.g. cancer, comparises comparing the binding of the polypeptide to the candidate agent and to a control agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to novel agents that modulates the function of buman apoptosis associated proteins specified within the specification. Specifically, it refers to a method for the identification of target genes whose expression is correlated with an early stage in the regulation of apoptosis. The present invention describes a method of contacting either candidate agents or control agents to the target genes and assessing the difference of binding and inhibitory activity, where the candidate agent is selected from a low molecular weight organic molecule, an antibody or fragment thereof, an antisense oligonucleotide, a small inhibitory dsRNA, or a ribozyme. As such, the compositions and methods are useful for diagnosing and treating diseases or conditions associated with abnormal apoptosis in mammalian tissue, such as cancer, inflammation, autoimmune or neurodegenerative disorders. Accordingly, they exhibit cytostatic, antiinflammatory, immunosuppressive and
                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                    2274 CTTCCAGCAATTTAGCATGCAAGTTCAAGCTTGGGAAACTCTGGAGAGA 2324

This invention relates to novel agents that modulates the function of human apoptoais-associated proteins specified within the specification. Specifically, it refers to a method for the identification of target genes whose expression is correlated with an early stage in the regulation of apoptosis. The present invention describes a method of contacting either candidate agents or control agents to the target genes contacting either candidate agents or control agents to the target genes and assessing the difference of binding and inhibitory activity, where the candidate agent is selected from a low molecular weight organic molecule, an antibody or fragment thereof, an antisense oligonuclectide, as small inhibitory dSRNA, or a ribozyme. As such, the compositions and methods are useful for diagnosing and treating diseases or conditions associated with abnormal apoptosis in mammalian tissue, such as cancer, inflammation, autoinmune or neurodogenerative disorders. Accordingly, they exhibit cytostatic, antiinflammatory, immunosuppressive and compositivities. These may also be used for drug screening purposes and in gene therapy. This oligonuclectide sequence is a quantitative PCR primer used to amplify a target gene associated with an exemplification of the invention.
                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying an agent that modulates the function of an apoptosis-
associated polypeptide, useful for diagnosing or treating e.g. cancer,
comprises comparing the binding of the polypeptide to the candidate agent
and to a control agent.
neuroprotective activities. These may also be used for drug screening purposes and in gene therapy. This oligonucleotide sequence is a quantitative PCR primer used to amplify a target gene associated with apoptosis regulation, given in an exemplification of the invention.

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and influencial interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB70202). The sequence data for this parent did not form part of the princed specification, but was obtained in electronic form part of the from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                              detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more sense from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30513), expressed DNA sequences (ABLi6176-ABL30513), expressed DNA sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL/6176-ABL3051), expressed DNA sequences (ABL/6175) and the encoded proteins (ABB57737-ABR2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (AB116176-AB130511), expressed DNA sequences (AB101840-AB116175) and the encoded proteins (ABB57377-ABB72072). The sequence data for this patent did not form part of the printed specification, but, was obtained in electronic format directly

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABL30212). The sequence data for this parent did not form part of the printed specification, but was obtained in electronic form part of from MIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           \int^{\text{/teg}} = a /nete = "Oligo dT bases added to the 3' end to stabilise binding"
                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense GMPR2 siRNA oligomer to knockout apoptosis related gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    se; DNA/RNA hybrid; apoptosis; cancer; inflammation; autoimmune;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and influencial interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLis176-ABL30511), expressed DNA sequences (ABLis175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more sense from brosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                              Drosophila melanogaster expressed polynucleotide SEQ ID NO 22850.

This invention relates to novel agents that modulates the function of human apoptosis-associated proteins specified within the specification. Specifically, it refers to a method for the identification of target genes whose expression is correlated with an early stage in the regulation of apoptosis. The present invention describes a method of contacting either candidate agents or control agents to the target genes contacting either candidate agent of no molecular weight organic molecule, an antibody or fragment thereof, an antisense oligonucleotide, a small inhibitory daRNA, or a ribozyme. As such, the compositions and methods are useful for diagnosing and treating diseases or conditions associated with abnormal apoptosis in mammalian tissue, such as cancer, inflammation, autoimmune or neurodegenerative disorders. Accordingly, they exhibit cytostatic, antiinflammatory, immunosuppressive and neuroprotective activities. These may also be used for drug screening purposes and in gene therapy. This oligonucleotide sequence is an siRNA oligo used to knockout expression of a human gene identified to be associated with the regulation of a human gene identified to be
                                                                             Identifying an agent that modulates the function of an apoptosis-associated polypeptide, useful for diagnosing or treating e.g. cancer, comprises comparing the binding of the polypeptide to the candidate agent and to a control agent.
                                                                                                                                                                                                                                                                                                                                                                                       Example 5; Page 293; 304pp; English.

The invention provides a composition comprising at least one oligonucleotide, of 9-35 bases, that binds specifically to part of the oligonucleotide, of 9-35 bases, that binds specifically to part of the mRNA, expressed from the gene encoding a mammalian betal-adrenoceptor propertie. Binding of the oligo to the betal-adrenoceptor mRNA alters transcription of the mRNA in cells. The compositions are used to treat diseases associated with increased number or activity of the betal-adrenoceptor polypeptide, specifically hypertension and myocardial ischemia. The compositions can also be used to produce recombinant ischemia. The antisense oligos may also be used to detect the mRNA or related DNA, including visualization within a cell, to generate transgenic animals with altered betal-adrenoceptor activity, and to screen patients for susceptibility to hypertension, by detection of particular alleles of betal-adrenoceptor genes. The present sequence represents the polymuclectide sequence of the canine betal-adrenoceptor (GenBank Acon No: U73207)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense oligonucleotides that specifically bind to mRNA encoding beta 1-adrenoreceptor polypeptide, useful for treating cardiac dysfunction, hypertension, hypertrophy and other cardiovascular diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated antisense oligonucleotide of 9-35 nucleotides in length, which specifically binds to a portion of an mRNA expressed from a gene encoding a mammalian betal-adrenoceptor (AR) polypeptide and alters the translation of the mRNA into the betal-AR polypeptide in a host cell expressing the mRNA. Also included are a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ds; antisense; betal adrenoceptor; betal-AR; vasotropic; hypotensive; cardiant; hypertension; hypertrophy; cardiac ischaemia; cardiovascular disease; cardiac dysfunction; gene.

cell comprising the antisense oligonuclectide, and a host cell comprising the vector. A composition comprising the antisense oligonuclectides is useful in the manufacture of a medicament for use in treating or ameliorating hypertension, hypertrophy and cardiac ischaemia in a manumal. A composition comprising the antisense oligonuclectides is also useful for reducing the level of betal-AR polypeptide, the transcription of betal-AR polypeptide specific mRNA in a mammalian host cell, particularly human cell, and for decreasing blood pressure in a promoter capable of expressing the oligonuclectide is operably linked to a promoter capable of expressing the oligonuclectide in the cell. A promoter capable of expressing the oligonuclectide such comprises composition comprising a selected nucleic acid segment that comprises plumiclectide operatively linked to a promoter capable of expressing the collynuclectide in a cell is also useful for reducing the level of beta_l-collynuclectide in a cell is also useful for reducing the level of beta_l-collynuclectide is also useful for cher cardiavacturar diseases and cardiac dysfunction in humans. The present sequence is a mammalian betal-capable in a cell is also useful for antisense colligonuclectide is a mammalian betal-capable of expression in humans. The present sequence is a mammalian betal-capable in a cell is also useful for antisense oligonuclectides of the antisense oligonuclectides of the cardiac dysfunction in humans. The present sequence is a mammalian betal-capable in the mRNA for which is a target for antisense oligonuclectides of

The present sequence represents an antisense oligonucleotide which inhibits human aspartyl (apparaginyl) beta-hydroxylase (HAAH) gene.

Epidermal growth factor (EGF)-like domains of polypeptides are bydroxylated by HAAH enzymes. HAAH is used in the method of the invention. The specification describes a method for diagnosing a malignant neoplasm in a mammal. The method comprises contacting a body fluid with an antibody which binds to HAAH polypeptide under complex method is useful for diagnosing and prognosing a malignant neoplasm in a bodily fluid e.g. central nervous system (CSS) derived body fluid, blood, serum, urine, saliva, sputum, lung effusion, and ascites fluid of mammal, where the neoplasm is derived from endodermal tissue and is selected from colon canner, breast cancer, paracreatic cancer, liver cancer, cancer of bile ducts, and cancer of the CNS. HAAH antibodies, linked to a cytotoxic agent, are useful for killing tumour cells

        Upregulation of SAP
protein-mediated signal transduction in a patient. Upregulation of SAPE family members can be used for the treatment of diseases involving insufficient antigen specific T cell activation (e.g. X-linked prolliferative disease (XLP), tuberculosis, AIDS, schistosomiasis) or cancer (e.g. breast cancer, leukemia), or leprosy Downregulation of SAP family members can be used for the treatment of activation (e.g. autoimmune diseases). The products can also be used featertion and diagnosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents an antisense oligonuclectide which inhibits human aspartyl (asparaginyl) beta-hydroxylase (HAAH) gene. Epidermal growth factor (EGF)-like domains of polypeptides are hydroxylated by HAAH enzymes. HAAH is used in the method of the invention. The specification describes a method for diagnosing a malignant neoplasm in amammal. The method comprises contacting a body fluid with an antibody which binds to HAAH polypeptide under complex forming conditions, and detecting the antigen-antibody complex. The method is useful for diagnosing and prognosing a malignant neoplasm in a bodily fluid e.g. central nervous system (CNS)-derived body fluid, blood, serum, urine, saliva, sputum, lung effusion, and ascites fluid of mammal, where the neoplasm is derived from endodermal tissue and is selected from

The present sequence represents an antisense oligonucleotide which inhibits human aspartyl (asparaginyl) beta-hydroxylase (HAAH) gene. Epidermal growth factor (EGF)-like domains of polypeptides are hydroxylated by HAAH enzymes. HAAH is used in the method of the invention. The specification describes a method for diagnosing a malgmant neoplasm in a mammal. The method comprises contacting a body fluid with an antibody which binds to HAAH polypeptide under complex forming conditions, and detecting the antigen-antibody complex. The method is useful for diagnosing and prognosing a malignant neoplasm in a bodily fluid e.g. central nervous system (CNS)-derived body fluid, blood, serum, urine, saliva, sputum, lung effusion, and ascites fluid of mammal, where the neoplasm is derived from endodermal tissue and is selected from

Diagnosing neoplasm and inhibiting tumor growth, by contacting tissue of mammal with detectably-labeled antibody which binds to human aspartyl (asparaginyl) beta-hydroxylase.

Example 6; Page 18; 34pp; English.

The invention relates to diagnosing a neoplasm and inhibiting tumour of growth in a wammal, using an antibody that binds to human aspartyl caparaginyl beter bydroxylase (HAAH). Diagnosing a neoplasm comprises contacting a tissue with a detectably-labelled antibody where an increase in level of antibody binding at tissue site compared to the level of increase of binding to normal non-neoplastic tissue indicates the presence of a comparation of antibody binding at tissue site compared to the level of binding to normal non-neoplastic tissue indicates the presence of a daministering the antibody conjugated to a cytotoxic agent to a mammal. Also included are a method of conferring an immune response to a tumour captories fite immune response in a mammal, by administering to the mammal that polypeptide (or a polynucleotide composition encoding the extracellular domain and lacking a cytoplasmic domain of HAAH; omprising an extracellular domain and lacking a cytoplasmic domain of HAAH; which lacks enzymatic attibody or its fragment which binds to HAAH (where the antibody is FB50, FBA, SC7 or 198), a hybridoma cell line chosen from hybridoma FB50, attibody or its fragment which binds to HAAH (where the antibody is FB50, EBA, SC7 or 198), a hybridoma cell line chosen from hybridoma FB50, actor (EGS)-like domain. The methods are useful for diagnosing neoplasm or nemanal, inhibiting tumour growth in a mammal, inhibiting tumour growth in a mammal, inhibiting tumour cell (e.g. glinoma, glioblastoma, astrocytoma or nemanal, inhibiting tumour growth in a mammal inhibiting tumour cell for diagnosing malignant complasms derived from endodermal tissue, e.g. colon cancer, breast compense in a mammal. The method is useful for diagnosing malignant (RNS) e.g. primary malignant CNS eneoplasms of central nervous system (CNS) e.g. primary malignant CNS neoplasms of central nervous system cell or sign and method is also useful for diagnosing neoplasms of central nervous system cell origin and method is also central order of primary and g (CNS) e.g. primary malignant CNS neoplasms of both neuronal and gli cell origin and metastatic CNS neoplasms, and for disgnosing brain tumours e.g. glioma, glioblastoma, astrocytoma or haemangioma. The present sequence represents a Human HAAH antisense oligonucleotide

ō Diagnosing neoplasm and inhibiting tumor growth, by contacting tissue mammal with detectably-labeled antibody which binds to human aspartyl (asparaginyl) beta-hydroxylase.

Example 6; Page 18; 34pp; English.

The invention relates to diagnosing a neoplasm and inhibiting tumour of growth in a mammal, using an antibody that binds to human aspartyl (asparaginyl) beca-hydroxylase (HAAH). Diagnosing a neoplasm comprises contacting a tissue with a detectably-labelled antibody where an increase in level of antibody binding at tissue site compared to the level of binding to normal non-neoplastic tissue indicates the presence of a contacting the antibody binding at tissue site. Inhibiting tumour growth in mammal involves administering the antibody conjugated to a cytotoxic agent to a mammal. Also included are a method of conferring an immune response to a tumour cell in a mammal, by administering the antibody, a method of inducing an HAAH polypeptide (or a polymucleotide composition encoding the antibody or its degenerate variant), a fragment of HAAH comprising an extracellular domain and lacking a cytoplasmic domain of HAAH, an antibody or its fragment which binds to HAAH (where the antibody is FB50, 684, 557 or 198), a hybridoma cell line chosen from hybridoma FB50, HA386A, HA35CA and HAA189, and a fragment of HAAH (where the antibody is FB50, 685, 557 or 198), a hybridoma cell line chosen from hybridoma relectively or alpha-ketcoglutarate binding domain and epidermal growth factor (EGF)-like domain. The methods are useful for diagnosing neoplasm correction a mammal, for conferring immune response to a pencratic carcinoma cell and for inducing a HAAH-specific immune response in a mammal. The method is useful for diagnosing malignant concert, pancreatic cancer, liver cancer and cancer of the bile ducts. The method is also useful for diagnosing neoplasms of central nervous system concer, pancreating cancer, liver cancer and cancer of the bile ducts. The method is also useful for diagnosing neoplasms of central nervous system (CNS) e.g. primary malignant CNS neoplasms of central nervous system concer, pancreatic cancer, liver cancer and cancer of the bile ducts.

activity or alpha-ketoglurante binding domain and epidermal growth
factor (EGF)-like domain. The methods are useful for diagnosing neoplasm
factor (EGF)-like domain. The methods are useful for diagnosing neoplasm
in a mammal, inhibiting tumour growth in a mammal, conferring an immune
response to a brain tumour cell (e.g. glioma, glioblastoma, astrocytoma
or haemangioma) in a mammal, for conferring immune response to a
pancreatic carcinoma cell and for inducing a HAAH-specific immune
response in a mammal. The method is useful for diagnosing malignant
cancer, pancreatic cancer, liver cancer and cancer of the bile ducts. The
method is also useful for diagnosing neoplasms of central nervous system
(CNS) e.g. primary malignant CNS neoplasms of both neuronal and glial
cell origin and metastatic CNS neoplasms, and for diagnosing brain
tumours e.g. glioma, glioblastoma, astrocytoma or haemangioma. The
tumours e.g. glioma, glioblastoma, astrocytoma or haemangioma. The
tumours e.g. glioma, glioblastoma, astrocytoma or haemangioma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying an agent that modulates the function of an apoptosis-associated polypeptide, useful for diagnosing or treating e.g. cancer, comprises comparing the binding of the polypeptide to the candidate agent and to a control agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /*tag= a

Specifically, it refers to a method for the identification of target genes whose expression is correlated with an early stage in the regulation of apoptosis. The present invention describes a method of contacting either candidate agents or control agents to the target genes and assessing the difference of binding and inhibitory activity, where the candidate agent is selected from a low molecular weight organic molecule, an antibody or fragment thereof, an antisense oligonucleotide, a small inhibitory dispray, or a ribozyme. As such, the compositions and methods are useful for diagnosing and treating diseases or conditions and associated with abnormal apoptosis in mammalian tissue, such as cancer, inflammation, autoimmune or neurodegenerative disorders. Accordingly, neuroprotective activities. These may also be used for drug screening organical and in gene therapy. This oligonucleotide sequence is an siRNA cassociated with the regulation of a human gene identified to be associated with the regulation of apoptosis, given in an exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; probe; ss; gene expression; single exon probe; microarray; alternative splicing event; genomic alteration.

                     The invention describes a new isolated nucleic acid encoding a Klebsiella pneumoniae polypeptide. Also described are: a recombinant expression vector comprising the nucleic acid, operably linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This sequence encodes a Klebsiella pneumoniae polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Stably transformed cells expressing endorphin, enkephalin and catecholamine - and artificial organs contg. them, useful for control of pain, esp. implanted in the CNS.

                                   A DNA sequence (AATG2523) comprising a fusion between IgSP and human proposiomelanocortin (POMC) DNA can be utilised in the construction of vectors for the expression of endorphin apds. Cleavage enzymes present in host cells can generate a suite of endorphins from POMC, some or all of which have analgesic properties. A DNA sequence (see also AATG2524) in which the ACTH coding region of the POMC gene is delated its preferred. Host cells transformed with vectors (or a single polycistronic vector) encoding analgesic cpds. can be encapsulated to form bioartificial organs that are implanted into a patient for control of pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; nootropic; neuroprotective; cytostatic; dermatological; virucide; immunosuppressive; antiinflammatory; anti-HIV; antibacterial; vulnerary; antiparkinsonian; antisickling; antianamentc; antiarthritic; cancer; antisheumatic; hepatotropic, cereborprotective; antiinflammatory; antiallergic; antidiabetic; antiulcer; anticonvulsant; antifungal; antiparastitic; cardiant; immune disorder; cardiovascular disorder; neurological disease; infection; nephrotropic; gene therapy; vaccine; ds.

Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system cancers and metastases.

Disclosure; SEQ ID NO 11509; 1701pp + Sequence Listing; English.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: a) cancer. e.g. breast and covarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune consorder, autoimmune hawolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as wycardial ischeemias; (d) wound healing (e) infectious diseases such as viral, bacterial, fungal and parasitic infectious diseases such as viral, bacterial, fungal and parasitic the printed specification, but was obtained in electronic format directly con WIPO at ftp.wipo.int/pub/published_pct_sequences

The agent is especially useful for treating pain associated with chronic inflammatory disorders. The neuroendoorine may be pro-opiomelanocortin (POMC) or corticotrophin-releasing factor (CRF). The present sequence is a fragment of the human POMC coding sequence

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapp. The human colorance of the invention may have a use in gene therapp. The human against the against a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorder, endocrine cutoimmune/inflammatory disorder, developmental disorders, endocrine disorder, neurological disorders, developmental disorders, or clinections caused by virus, bacteria, fungi or parasite. The ditup from minter biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germine polymorphisms, as molecular weight markers, and for somatic or germine content the invention. Note: The sequence data for this patent is not represented the invention of specification, but was obtained in electronic format chiractly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                    Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIL16176-ABIJ1051), expressed DNA sequences (ABIL16176-ABIJ1051), expressed DNA ABIJ2072). The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this parent did not form part of printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F; Harthshorne TA, Suchorolski MT, Altus CM, Pitts SJ, Elder LV;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnost e g. cell proliferative disorders, associated with human molecules, e.g. cell proliferative disorders, endocrine cautoimmus/inflammatory disorder, developmental disorders, or disorder, neurological disorders, developmental disorders, or infections caused by virus, bacteria, fungi or paramite. The dithp conditions also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline the invention. Note: The sequence represents a dithp polymorleotide of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from NIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therappy. The human diagnostic and therapeutic polynucleotides (dithp) or polypepides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorders, or disorder, interological disorders, developmental disorders, or infections caused by virus, beatrointestinal disorders, or infections caused by virus, partering aftering in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence represents a dithp polynucleotide of the invention. Note: The sequence data for this patent is not represented the printed specification, but was obtained in electronic format the present was used to the present sequence data for this patent is not represented the printed specification, but was obtained in electronic format caused the present sequence are sequenced.

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therappy. The human polynucleotide of the invention may have a use in gene therappy. The human condition, disease or disorder associated used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorder, endocrine autoimmune/inflammatory disorder, developmental disorders, or disorder, autoimmune/inflammatory disorder, developmental disorders, or disorder, disorder, disorders, or infections caused by virus, bacteria, fungi or parasite. The dituper of infections caused by virus, bacteria, fungi or parasite. The dituper of molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide of polymorphisms, as molecular weight markers, and for somatic or germine gene therapy. The present sequence represents a ditup polynucleotide of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format currently from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                    This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAZ24802) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 95 novel genes and their fragments (mucleic acid sequences: AAZ24811-Z24907; amino acid sequences AAY41308-Y41404) which are useful for preventing, treating acid sequences AAY41308-Y41404) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polympeides in a sample or by determining the presence of mutations in the new polymucleotides. Specific uses are described for each of the 95 polymucleotides, based on which tissues they are most highly expressed in (see AAZ24811 for described uses)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MALY/)
           The invention relates to a novel isolated NOVX polypeptide. The polypeptide of the invention demonstrates, antidiabetic, anorectic, cardiant, hypotensive, antiarteriosclerotic, virucide, antiparterial, fungicide, proteozoacide, noctropic, neuroprotective, antiparkinsonian, anticonvulsant, osceopathic, antiarthritic; antipartamatory functional anticonvulsant, osceopathic, antilatomatic and antilipaemic activities. The polypeptides, nucleic acid molecules and antilipaemic activities. The polypeptides, nucleic acid molecules and antilogement of secrets and observed infections diseases including metabolic disorders such as cradiovascular diseases including metabolic disorders such as cardiovascular diseases including mypertension and atherosclerosis, cardiovascular diseases including hypertension and atherosclerosis, cardiovascular diseases including hypertension and atherosclerosis, neurodegenerative disorders such as Alzabiamer's disease, Parkinson's disease and epilepsy, immune disorders, asthma and dyslipidaemia.

The neurodegenerative disorders and polypeptides may also be used to identify molecules that modulate or inhibit neurogenesis, cell anglogenesis, as well as in gene therapy. Finally, the nucleic acids may be used as hybridiation probes, in chromosome mapping, tissue typing, the human NOV cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to human NOVX polypeptides and the polynucleotides are useful for encoding them. The NOVX polypeptides and polynucleotides are useful for determining the presence of or predisposition to a disease associated with altered levels of the sequences in a mammalian subject, and for treating or preventing a pathology associated with NOVX. The polypeptides are useful for treating or preventing disorders or syndromes such as congenital heart defects, cardiomyopathy, atheroscierosis, hypertension, pulmonary stenosis, soleroderma, adenocarcinoma, haemophilia, graft-versus-host disease, cancer, neurodegenerative disorders, Alzheimer's disease, parkinson's disease, multiple sclerosis, diabetes, obesity, bronchial asthma, acquired immunodeficiency syndrome (AIDS), Crohn's disease, human NOVX polynucleotide of the invention. Note: The sequence data for this patent is also available from USPTO at sequence represents a human NOVX is also available from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

ARCT99126 to ACC79105 encode the human secreted proteins (I) given in ARE56726 to ABR56805, designated SECP-1 to SECP-80. SECP sequences can have cytostatic, antiateriosclerotic, anticonvulsant, antihillammatory, notropic, neuroprotective, crebroprotective, anti-HIV, antiallergic and thyromimetic activities, and can be used in gene therapy. The SECP proteins and polymucleotides can be used in diagnosing, treating and expression or conditions associated with the decreased expression or overexpression of SECP, such as cell proliferative (e.g. cancer, atherosclerosis), neurological (e.g. epilepsy, Huntington's disease, stroke), immune/inflammatory (e.g. AIDS, allergies) and developmental (e.g. hypothyroidism, Cushing's syndrome) disorders, or infections. They are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of SECP. The SECP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polynucleotide and compounds that specifically bind to or modulate the activity of the polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 1418 BP; 168 A; 542 C; 442 G; 266 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention i useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequence data for this parter did not form part of the printed specification, but was obtained in electronic form part of the from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present invention relates to polynucleotide sequences, and the proteins they encode. The sequences are isolated from a variety of proteins they encode. The sequences are isolated from a variety of organisms such as plants (e.g. maize, rice, sorghum, thale cress, cognes, and wheat), cyanobacteria, bacteria, yeast and other fungi. The polynucleotide and polypeptide sequences of the invention are useful in the production of transgenic plants that have improved properties. Also disclosed are methods of producing fertile transgenic plants, preferably maize, with desired phenotypes. The polynucleotide and polypeptide sequences are useful for improving plants by providing protection against compitying the cell cycle pathway, reducing plant height, modifying the cell cycle pathway, reducing plant height, modifying crop productivity, improving plant carbohydrate transport, improving disease resistance, improving disease resistance, improving crop productivity, improving plant sets resistance, improving crop heat tolerance, improving stalk strength, improving water stress tolerance, improving resistance to oxidative stress tolerance, improving resistance to oxidative stress tolerance, improving resistance to oxidative stress providing increased vigour, reducing sensecence, and conferring virus resistance. The present sequence represents a polynucleotide sequence of the invention. Note: The sequence data for this patent is not provided in the printed apecification but is obtained in electronic format from the USPPO website at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide, useful for manipulating plant protein quality, improving plant growth, yield and crop productivity or grain composition or producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

The invention relates to plant nucleotide sequences that direct seed.,

c leaf- and/or stem., panicle., root- or pollen-specific or -preferential

c c constitutive transcription of an operatively linked nucleic acid

c segment. The invention also relates to a method for augmenting a plant

c segment. The seed, leaf, stem, panicle, pollen, root or is constitutive

c altered in the seed, leaf, stem, panicle, pollen, root or is constitutive

c altered in the seed, leaf, stem, panicle, pollen, root or is constitutive

c altered in the seed, leaf, stem, panicle, pollen, root or is constitutive

c altered in the seed, leaf, stem, panicle, pollen, root or is constitutive

c an a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sunflower,

c cancla, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

c corghum, rice or wheat. The polynucleotides and the polypeptides they

c encode are useful for manipulating crop plants to alter or improve

c phenotypic characteristics, to produce large quantities of oil or

c proteins, to incur resistance to insecticides, viruses or fungi, and to

c incur stress tolerance (e.g. salt, cold or drought) to ensure the plants

c incur stress tolerance (e.g. salt, cold or drought) to ensure the plants

c incur stress tolerance (e.g. salt, reduced apical dominance or dwarfism,

c arly flowering or altered metabolic pathways. This sequence appresents a

constitution part of the pinnention. Note: The sequence apprentic a

c plant nucleic acid of the invention. Note: The sequence apprent of or electronic format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New rice promoter, useful for manipulating crop plants to alter or improve phenotypic characteristics, e.g. produce large quantities of oil or proteins, resistance to insecticides, virus or fungi, stress tolerance or high nutritional value.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Moughamer T, Briggs SP, Cooper B, Glaz

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, funginous viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              plant, gene; ss; transcription; plant genome augmentation; cereal; soybean; alfalfa; sunflower; canola; cotton; peanut; tobacco; sugar beet; amize; barley; sorghum; rice; wheat; crop plant; insecticide resistance; stress tolerance; cold tolerance; drought tolerance; plant nutrition; apical dominance; dwarfism; early flowering; antiviral;

The invention relates to isolated polymucleotide (I) and polypeptide (II)

sequences. (I) is useful as hybridiaation probes, polymerase chain

creation (PCR) primers, oligomers, and for chromosome and gene mapping,

and in recombinant production of (II). The polymucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed

confirmed to sexpressed sequence tags for identifying expressed

confirmed to sexpressed sequence tags for identifying expressed

confirmed to severating antibodies against it, detecting or quantitating a

confirmed to sequences are useful in medical imaging

confirmed to propopting the intensity and its binding partners are useful for treating disorders

confirmed and polymucleotide sequences have applications in

polypeptide and polymucleotide sequences have applications in

confirmed and polymucleotide sequences have applications in

confirmed to produce other types of data and products dependent on DNA and

confirmed and polymucleotide sequences or other traits to assess biodiversity

and to produce other types of data and products dependent on DNA and

confirmed and polymucleotide sequence data for this

confirmed and polymucleotide sequences or other traits to assess biodiversity

and to produce other types of data and products dependent on DNA and

confirmed and polymucleotide sequence data for this

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes primer sets for synthesising 5602 full-
length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polymucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the compination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polymucleotide which comprises a 5'-end complementary strand of a polymucleotide which comprises a 5'-end polymucleotide comprises a 3'-end sequence complementary to a polymucleotide comprises a 3'-end sequence complementary to a polymucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers are as an eased in antisense therapy and in gene therapy. The primers are and an ensure set and an ensure the complementary to particularly full-length cDNAs. The primers are also useful for the primers and or disgnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs. The primers allow obtaining of the full-length CDNAs easily without any specialised methods. AAH3363 to AAH13633 to AAH18633 to AAH18631 to AAH18632 represent human amino acid sequences; and AAH13629 to AAH33629 and consecution in the exemplification of the process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

The invention comprises the amino acid and coding sequences of proteins which have enzyme activity or protease, phosphodiesterase, transferase, or isomerase inhibitor activity. The DNA and protein sequences of the invention are useful for treating disorders associated with the proteins, such as blood clotting or circulatory disorders. The present DNA sequence represents a novel mouse gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protease inhibitors, proteases, phosphodiesterases, transferases, isomerases and substances that affect their activity or expression useful for treating associated disorders.
